

## Company Project 1 — Website Redesign Brief

### Company Chosen

**Telspace Systems (Africa)** Industry: Information security / cybersecurity consulting (penetration testing, security training, security research) Current website:

[telspace.africa](https://telspace.africa) Location: Hyde Park, Johannesburg, South Africa

### How I Found Them

I came across Telspace Africa through the CTF (Capture the Flag) competition they ran at the ITWeb Security Summit 2026, which I competed in and scored a perfect solo 10/10 on. That's where I first encountered them directly, rather than through a generic search.

### Why I Chose This Company

I chose Telspace because of that direct connection through their CTF — I already have real, personal experience with their work and community presence, not just a passing impression of their brand. As a software development student moving toward cybersecurity, I'd genuinely love the opportunity to build something for them one day, like a dedicated CTF platform/website for their events. Redesigning their site is a way to demonstrate that intent with real work, not just a pitch.

### Why Their Website Needs a Redesign

Evidence gathered from the live site ([telspace.africa](https://telspace.africa)), both desktop and mobile views.

**Dated visual style (desktop hero)** The homepage hero uses a torn-paper/photo-collage effect over a stock-style black-and-white image — a design trend that was common roughly 2014–2018 and has since been replaced by cleaner, more minimal hero treatments in current design standards. The layout follows a generic template pattern (bold headline left, stock photo right, single button) rather than anything custom-built for the brand. For a company whose business is convincing enterprise clients to trust them with security, the visual presentation undersells their credibility — it reads more like a small dev shop's site than an established, 20+ year infosec firm.

**Poor mobile responsiveness** On a phone-width viewport, the hero headline ("HACKERS FOR HIRE") wraps across three full lines and dominates the entire screen, with the "SINCE 2002" sub-line cramped directly beneath it with almost no spacing. The background image/text composition isn't reflowed for mobile — it's the same desktop layout simply scaled down, resulting in awkward cropping of the collage image. This is one of the clearest, most concrete issues found.

**Weak/unclear navigation** On mobile, navigation collapses to a bare "MENU" label with a hamburger icon and no visual weight — there's no indication of what's inside until

tapped. On desktop, the nav bar is plain text links with no hover/active states, giving no sense of where a visitor currently is on the site.

**Vague, single call-to-action** The only CTA on the homepage hero is "WHAT WE DO" — this doesn't tell a visitor what action to take (e.g. request a quote, book an assessment, contact the team). For a business that needs to convert visitor interest into actual client engagements, this is a missed opportunity.

**Inefficient use of screen space (mobile)** The hero section takes up nearly the full first screen and then some — a visitor has to scroll past a very tall hero just to reach the "ABOUT US" section, which is a lot of scrolling before reaching any real content.

**Messaging risk** "Hackers for Hire" is a bold, memorable tagline, but for enterprise clients evaluating a security vendor, it could read as ambiguous or alarming rather than reassuring — a positioning issue as much as a visual one.

## **Redesign Direction**

The redesign keeps Telspace's actual brand color (their signature blue) and dark navy palette intact — this is a redesign, not a rebrand but replaces the dated collage hero with a cleaner layout anchored by a live, self-typing terminal-log animation that simulates an authorized security scan, tying the visual concept directly to what the company actually does. It adds a clear, specific primary CTA ("Request an engagement"), a trust-signal stats strip (years in operation, engagements delivered, countries served) above the fold, a responsive mobile-first layout with proper nav collapse, and a real contact form directly addressing each issue documented above.
